N-SUBSTITUTED LACTAMS  
USEFUL AS CHOLECYSTOKININ  
ANTAGONISTS

FIELD OF THE INVENTION

The invention herein is directed to N-substituted lactams which can be useful in the treatment and prevention of cholecystokinin (CCK) related disorders of the gastrointestinal, central nervous and appetite regulatory systems of mammals by administering to a subject in need thereof a therapeutically effective amount of a compound disclosed herein or a pharmaceutically acceptable salt thereof. Therefore, the compounds of the invention find utility in GI motility disorders including irritable bowel syndrome, visceral pain, reversing satiety, and in treating anxiety. Also, the compounds of the invention are useful in the treatment of pancreatitis and pancreatic cancer.

Background of the Invention

Cholecystokinin (CCK) is a brain/gut neuropeptide which has been implicated in a number of central nervous system and gastrointestinal disease states [Reviews: J. A. Williams, Biomedical Research (1982), 3, 107; M. Albus, Prog. Neuro-Psychopharmacol & Biol. Psychiat. (1988), 12, p S5]. Cholecystokinin in the GI tract evokes contraction of gut smooth musculature [U. Scheurer et al, Am. J. Physiol. (1983,

244, G266], and functionally causes delayed gastric emptying, contraction of the gall bladder [E. Corazziari et al, Dig. Dis. & Sci. (1991), 35, 50], initiation of the gastrocolic reflex [R. F. Harvey and A. E. Read, The Lancet (1973), Sat. 6 January, p. 7793]. CCK plays an important physiologic role in pancreatic function and secretion. Abnormalities of CCK have been implicated in causing pancreatitis [C. Niederau et al, Gastroenterology (1985), 88, 1192]. Abnormalities of CCK function in the GI tract may be causative in a number of GI motility disorders, including irritable bowel syndrome. Additionally, CCK acts as a physiologic opiate antagonist, and has been reported to be hyperalgesic, and to inhibit analgesia produced by opiates [P. L. Faris et al, Science (1983), 219, 310; N. S. Baber et al, Pain (1989), 39, 307].

Actions of CCK in the central nervous system have demonstrated a role for CCK in controlling eating behavior (producing satiety; [G. P. Smith in Eating and Its Disorders (A. J. Stunkard & E. Stellar, Eds), (1984), pp. 67-75, Raven Press], in producing symptoms of panic disorder & other forms of anxiety [Trends in Pharmacol. Sci. (1990), 11, 271], and in modulating mesolimbic dopamine release [J. N. Crawley in

Cholecystokinin Antagonists (R. Y. Wang R. Schoenfeld, eds., (1988), pp. 243-262, Alan R. Liss].

Finally, CCK and/or gastrin have been implicated as tumorigenic in a number of cancers, including cancers of the pancreas and the colon [S. A. Watson et al, GUT (1989, 30, 1447; B. R. Douglas et al, Cancer Research (1989), 49, 2438].

Thus, an antagonist to CCK at either the A-receptor subtype or the B-receptor subtype may be useful in the treatment of GI motility disorders (including irritable bowel syndrome), eating disorders where an anti-satiety effect is desired, panic-like anxiety, compulsive behavior and other CNS disorders.

United States Patent 4,757,068 discloses a class of lactams and bicyclic lactams which are useful in the treatment and prevention of CCK-related disorders of the gastrointestinal, central nervous and appetite regulatory systems of mammals. The compounds of this disclosure are structurally distinct from the present invention.

bicyclic  $\beta$ -lactam penicillin analogs having anti-bacterial activity. The compounds of this disclosure are distinct from the compounds of the present invention both in structure and utility.

United States Patent 3,474,093 discloses pyrrolidinone, indolinone, cycloheptapyrrolone and cyclopentapyrrolone adducts of N-acyloxy-N-acylaminoacetanilides useful as hyperemic depressants, anti-convulsants and antiarrhythmic agents.

Included within the embodiments of the present invention are the tautomeric forms of the described compounds, isomeric forms including geometric isomers, enantiomers and diastereoisomers, and the pharmaceutically acceptable salts thereof.

The term "pharmaceutically-acceptable salts" embraces salts commonly used to form alkali metal salts and to form addition salts of free acids or free bases. Since the compounds of Formulas I, II and III contain basic nitrogen atoms, such salts are typically acid addition salts or quaternary salts. The nature of the salt is not critical,

provided that it is pharmaceutically acceptable, and acids which may be employed to form such salts are, of course, well known to those skilled in this art. Examples of acids which may be employed to form pharmaceutically acceptable acid addition salts include such inorganic acids as hydrochloric acid, sulphuric acid and phosphoric acid, and such organic acids as maleic acid, succinic acid and citric acid. Other pharmaceutically acceptable salts include salts with alkali metals or alkaline earth metals, such as sodium, potassium, calcium and magnesium, or with organic bases, such as dicyclohexylamine. All of these salts may be prepared by conventional means by reacting, for example, the appropriate acid or base with the corresponding compound of Formulas I, II and III.

## SCHEME I: SYNTHESIS OF PYRRIDINONE CCK ANTAGONISTS

The synthesis of compounds of Formula I wherein n equals 1 and R, R<sub>1</sub>, R'<sub>1</sub>, Ar, m, Y and X are defined as before and R<sub>2</sub> is hydrogen, R<sub>3</sub> is CH<sub>3</sub> or OR<sub>4</sub> wherein R<sub>4</sub> is alkyl of 1 to 6 carbon atoms and (Scheme I) involves the use of methodology reported by Southwick et al. [J. Org. Chem. 21, 1087 (1956) & J. Am. Chem. Soc. 75, 3413 (1953)] for the preparation of intermediate 2. Thus the appropriate acrylate ester 1 optionally mono- or di-substituted in the beta position is reacted with the desired aliphatic or aromatic amine (RNH<sub>2</sub>). For an aliphatic amine, the reaction is carried out in ethanol; whereas, for an aromatic amine, the reaction is accomplished in benzene with an acid catalyst such as tin tetrachloride. Subsequent reaction of the intermediate beta-amino ester species with the appropriate oxalate diester and the corresponding alkoxide followed by quenching with an acid, preferably HCl, gives the pyrrolidinone 2. The oximes 2' are formed by reaction of 2 with hydroxylamine hydrochloride in pyridine. Hydrogenation of the resulting oxime with palladium on carbon proceeds stereospecifically to give the cis-substituted aminopyrrolidinone 3. N-acylation of 3 with (hetero)arylacids by using one of several common acid-activating reagents [CDI, DCC, SOCl<sub>2</sub>] gives the amide 4 [X is direct bond or CH<sub>2</sub>]. Alternatively, treating 3 with an

appropriate isocyanate or haloformate in the presence of a base such as triethylamine affords the pyrrolidinone urea [X = NH] or urethane [X = O] 4 respectively. Saponification of the ester moiety of 4 (for R<sub>3</sub> = Me, Et) affords the trans-substituted pyrrolidinone carboxylic acid 5. Alternatively ester cleavage of 4 (for R<sub>3</sub> = tert butyl) may be accomplished with an acid, preferably trifluoroacetic acid, affording the cis-substituted pyrrolidinone carboxylic acid 5.

The amides trans-6 and cis-6 are prepared by coupling trans-5 or cis-5, respectively, with an appropriate amine utilizing an acid-activating agent such as carbonyldiimidazole (CDI).

## SCHEME II: SYNTHESIS OF HOMOLOGATED PYRROLIDINONES

The synthesis of homologated pyrrolidinones ( $m = 1$  to  $3$ ) of Formula I wherein  $R_4$  is hydrogen or alkyl (Scheme II) again relies on methodology reported by Southwick (vide supra) for the preparation of intermediates 9. Hydrolysis and decarboxylation of pyrrolidinone ester 2 proceeds under acidic or basic conditions to give ketopyrrolidinone 9. The ketone 9 may optionally be alkylated in the 4-position ( $R_4$ ) by treatment with a base such as LDA and quenching with an alkylating agent  $R-Q$  such as methyl iodide. Subsequent reaction under basic conditions with an alkylating agent such as ethyl bromoacetate yields the alkylated ketopyrrolidinone 10. Formation of the oxime of ketone 10 with hydroxylamine hydrochloride in pyridine followed by hydrogenation with palladium on carbon affords the aminopyrrolidinone 11. N-acylation of 11 with (hetero)arylacids using above-described acid-activating reagents followed by ester hydrolysis affords the pyrrolidinone amide 12 [ $X$  is direct bond or  $CH_2$ ]. Alternatively, treating 11 with an appropriate isocyanate or an appropriate haloformate in the presence of a base such as triethylamine followed by ester hydrolysis affords the urea 12 [ $X = NH$ ] or urethane 12 [ $X = O$ ], respectively. The amides 13 are prepared by coupling 12 with the appropriate amine

36

utilizing an acid-activating agent such as  
carbonyldiimidazole (CDI).

SCHEME III: CHIRAL SYNTHESIS OF PYRROLIDINONES  
[\* and \*\* indicate individual isomers]

The synthesis of nonracemic pyrrolidinones of Formula I (Scheme III) utilizes methodology described by Dieter Enders et al. (Org. Syn. 65, 183 (1987)) to form the nonracemic intermediates 11\* and 11\*\*. Thus, reaction of ketopyrrolidinone 9 with commercially-available hydrazines (S)- or (R)-1-amino-2-methoxymethylpyrrolidine (SAMP or RAMP, respectively) in benzene under Dean-Stark conditions affords the corresponding hydrazone 14\* or 14\*\*. Reaction of each hydrazone individually under basic conditions with an electrophile such as ethyl bromoacetate affords alkylated hydrazones 15\* and 15\*\* in high diastereomeric excess. Removal of the hydrazone under hydrogenolysis conditions affords the cis-substituted aminopyrrolidinone 11\* or 11\*\*, depending upon the particular chiral hydrazine used. Coupling of the amines 11\* and 11\*\* followed by ester saponification proceeds as in Scheme II to afford the nonracemic cis-substituted pyrrolidinone 12\* and 12\*\* amides [X is a direct bond or CH<sub>2</sub>], ureas [X = NH], and urethanes [X = O] as described above in Scheme II.

## SCHEME IV: SYNTHESIS OF BETA-LACTAM CCK ANTAGONISTS

The synthesis of  $\beta$ -lactam of Formula I wherein  $n = 0$  (Scheme IV) involves the use of methodology reported by T. Kawabata et al. [J. Amer. Chem. Soc. (1989), 111, 6843 & Tetrahedron Letters (1989), 30, 4837] for the preparation of intermediates 20 and 21. Thus, the appropriate aliphatic or aromatic amine 16 is reacted sequentially with t-butylbromoacetate/triethylamine and N,N-dibenzylglycine acid chloride/triethylamine to afford the intermediates of general structure 17. Dianion formation with two equivalents of alkyl lithium base, followed by treatment with  $\text{Cu}(\text{OAc})_2$ , gives predominantly the trans-substituted azetidinone 19. Alternatively, substituting the reagent N-iodosuccinimide (NIS) in the second step affords predominately the cis-substituted azetidinone 18. When the amine 16 contains a homochiral R group, the azetidinones 18 & 19 may be prepared asymmetrically.

Deprotection of the dibenzylamine moiety by hydrogenolysis gives the 3-aminoazetidinones 20 and 21 from 18 and 19, respectively. N-Acylation with (hetero)arylacids by using one of several common acid-activating reagents [CDI, DCC,  $\text{SOCl}_2$ ] affords the corresponding amides 22a or 23a [X is direct bond or  $\text{CH}_2$ ]. Alternatively, treating 20 or 21 with

an appropriate isocyanate affords ureas 22b or 23b [ $X = NH$ ]. Alternatively, treating 20 or 21 with the appropriate haloformate gives rise to urethanes 22c or 23c [ $X = O$ ]. Alternatively, treating 20 or 21 with an (hetero)aryl sulfonylchloride in the presence of base such as triethylamine gives sulfonamides of formulae 22 or 23 ( $Y=SO_2$ ). Compounds of general formulae 22 and 23 are converted to the carboxylic acids 24 and 25 by treatment with an acid, preferably trifluoroacetic acid.

This invention also relates to a method of treatment and prevention of cholecystokinin (CCK) related disorders of the gastrointestinal, central nervous and appetite regulatory systems of mammals, and more specifically, a method of treatment involving the administration of compounds of Formula I as the active ingredient.

For the treatment and prevention of CCK related disorders compounds of Formula I may be administered orally, topically, parenterally, or by inhalation spray or rectally in dosage unit formulations containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles. The term parenteral as used herein includes subcutaneous

injections, intravenous, intramuscular, intrasternal injection or infusion techniques.

The compounds of the present invention may be administered by any suitable route, preferably in the form of a pharmaceutical composition adapted to such a route, and in a dose effective for the treatment intended. Therapeutically effective doses of the compounds of the present invention required to prevent or arrest the progress of the medical condition are readily ascertained by one of ordinary skill in the art.

Accordingly, the invention provides a class of novel pharmaceutical compositions comprising one or more compounds of the present invention in association with one or more non-toxic, pharmaceutically acceptable carriers and/or diluents and/or adjuvants (collectively referred to herein as "carrier" materials) and if desired other active ingredients. The compounds and composition may for example be administered intravascularly, intraperitoneally, subcutaneously, intramuscularly or topically.

For oral administration, the pharmaceutical composition may be in the form of, for example, a tablet, capsule, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit contained in a particular amount of the active ingredient. Examples of such dosage units are tablets or capsules. These may with advantage contain an amount of active ingredient from about 1 to 250 mg preferably from about 25 to 150 mg. A suitable daily dose for a mammal may vary widely depending on the condition of the patient and other factors. However, a dose of from about 0.1 to 3000 mg/kg body weight, particularly from about 1 to 100 mg/kg body weight may be appropriate.

The active ingredient may also be administered by injection as a composition wherein, for example, saline, dextrose or water may be used as a suitable carrier. A suitable daily dose is from about 0.1 to 100 mg/kg body weight injected per day in multiple doses depending on the disease being treated. A preferred daily dose would be from about 1 to 30 mg/kg body weight.

The dosage regimen for treating an infectious disease condition with the compounds and/or compositions of this

invention is selected in accordance with a variety of factors, including the type, age, weight, sex and medical condition of the patient; the severity of the infection; the route of administration; and the particular compound employed and thus may vary widely.

For therapeutic purposes, the compounds of this invention are ordinarily combined with one or more adjuvants appropriate to the indicated route of administration. If per os, the compounds may be admixed with lactose, sucrose, starch powder, cellulose esters of alkanolic acids, cellulose alkyl esters, talc, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulphuric acids, gelatin, acacia, sodium alginate, polyvinylpyrrolidone, and/or polyvinyl alcohol, and thus tableted or encapsulated for convenient administration. Alternatively, the compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, peanut oil, sesame oil, benzyl alcohol, sodium chloride, and/or various buffers. Other adjuvants and modes of administration are well and widely known in the pharmaceutical art. Appropriate dosages, in any given instance, of course depend upon the nature and severity of

the condition treated, the route of administration, and the species of mammal involved, including its size and any individual idiosyncrasies.

Representative carriers, diluents and adjuvants include for example, water, lactose, gelatin, starches, magnesium stearate, talc, vegetable oils, gums, polyalkylene glycols, petroleum jelly, etc. The pharmaceutical compositions may be made up in a solid form such as granules, powders or suppositories or in a liquid form such as solutions, suspensions or emulsions. The pharmaceutical compositions may be subjected to conventional pharmaceutical operations such as sterilization and/or may contain conventional pharmaceutical adjuvants such as preservatives, stabilizers, wetting agents, emulsifiers, buffers, etc.

Dosage levels of the order from about 0.01 mg to about 10 mg per kilogram of body weight per day are useful in the treatment of the above-indicated conditions (from about 10 mg to about 1000 mg per patient per day).

The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form

will vary depending upon the host treated and the particular mode of administration. For example, a formulation intended for the oral administration of subjects may contain from 5 mg to 1.0 g of active agent compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to 95 percent of the total composition. Dosage unit forms will generally contain between from about 25 mg to about 500 mg of active ingredient.

It will be understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

The following Examples are intended to further illustrate the present invention and not to limit the invention in spirit or scope. In the Examples, all parts are parts by weight unless otherwise expressly set forth.

## Example 74

Percent displacement of  $^{125}\text{I}$ -CCK-OP binding to rat pancreatic membrane and guinea pig brain homogenates by compounds of the instant invention at different concentrations was used to quantify CCK-A and CCK-B receptor binding, respectively.

Binding of  $^{125}\text{I}$ -CCK-OP to rat pancreas (CCK-A) and guinea pig brain (CCK-B) homogenates.

Rat pancreas or guinea pig brain was homogenized in 50 and 20 volumes, respectively, of 50 mM Tris-HCl buffer (pH 7.8 at 25°C) with a Brinkmann polytron homogenizer. The homogenates were centrifuged twice at 50,000 x g for 20 min with an intermediate rehomogenization in fresh buffer. The final pellets were resuspended in 20 volumes (brain) or 40 volumes (pancreas) of incubation buffer [50 mM Tris-HCl, 5 mM  $\text{MgCl}_2$ , 0.2% BSA, 5 mM dithiothreitol, 0.14 mg/ml bacitracin, pH 7.9 at 25°C]. One milliliter of the final homogenate from brain or pancreas was diluted to 50 mL with incubation buffer to use in the binding assay.

Binding experiments were performed in a final volume of 1 mL in 13x100 mm borosilicate disposable culture tubes. To

duplicate tubes were added 890  $\mu$ L of freshly resuspended pancreas or brain homogenate; 73,000 dpm of  $^{125}$ I-CCK-OP (final concentration, 12 pM) and 10  $\mu$ L of DMSO containing displacing agents (compounds or reference compounds, at the desired final concentrations). Nonspecific (nonsaturable) binding was determined in the presence of 1  $\mu$ M unlabeled CCK-OP. After incubation for 30 min at 37°C the binding was stopped by rapid filtration under a reduced pressure through glass fiber FPD-105 Whatman GF/B filters on Harvester and washed twice with 5 mL of ice-cold Tris buffer (50 mM Tris-HCl, pH 7.8). The radioactivity on the filters was counted in a gamma counter. Radioactivity adsorbed to filters (filter blanks) was less than 0.5% of total radioactivity and was not displaced by the addition of unlabeled CCK-OP. Specific binding was defined as the excess binding over that in blanks containing 1  $\mu$ M unlabeled CCK-OP.

#### Determination of $IC_{50}$ for displacing agents

The ability of compounds to displace  $^{125}$ I-CCK-OP binding to pancreatic or brain membrane homogenate was assessed in duplicate at concentrations varying from  $10^{-5}$  M to  $10^{-7}$  M. When the percent inhibition of specific  $^{125}$ I-CCK-OP binding by

the displacing agent at the highest screening concentration was  $\geq 50\%$ , the compound was considered as active and an  $IC_{50}$  value was determined. The  $IC_{50}$ , the concentration of compound that inhibits 50% of specific  $^{125}I$ -CCK-OP binding, was estimated graphically.

#### Rat Gastric Emptying Protocol

A test meal for measuring gastric emptying in rats was prepared. Ten grams of methylcellulose (2% solution = 15 centipoises; Aldrich Chemical Company, Milwaukee, WI) was added to 200ml of cold water and mixed at 20,000 rpm in a Waring blender to insure dispersion and hydration of the methylcellulose. In addition, two beef bouillon cubes (Wyler's, Columbus, OH) dissolved in 100ml of warm water was added to the mixture, followed by 16g of casein (Hammersten, Schwartz/Mann, Orangeburg, NY), 8g of powdered confectioners sugar and 8g of cornstarch. The ingredients were mixed for two minutes at 20,000 rpm and the resultant test meal was refrigerated for 48 hours to allow trapped air to escape. Male Charles River Rats, Crl: COBS, CD (SD) BR Strain, 180-200g body weight, were used in groups of six animals. The animals were food deprived for 24 hours prior to the experiment with access to water ad libitum. The compounds to be evaluated were prepared in a 0.5% aqueous methylcellulose solution. If insoluble, the mixture was homogenized for two minutes at 5500 rpm using a Try-R-Stir-R. The compounds were given intraperitoneally or intragastrically at a volume of 5ml/kg, 60 minutes or 90 min, respectively, before the test

meal. Control animals received only the vehicle. Cholecystokinin (100  $\mu$ g/Kg, i.p.) was given 30 minutes before the test meal to delay gastric emptying by an effect elicited through CCK receptors. Sixty minutes after the test meal (2.0ml/rat, i.g.), the rats were sacrificed by CO<sub>2</sub> asphyxiation. The stomachs were removed intact and weighed. The stomachs were kept opened, gently rinsed with tap water, blotted dry with paper toweling, and the empty stomach weighed. The difference between the weight of the full and empty stomach is indicative of the amount of meal remaining in the stomach. The amount of meal remaining in the stomach was subtracted from the weight of 3ml of the test meal to determine the amount of food emptied from the stomach during the test. Weight of the test meal was determined by weighing three samples (3ml) at the beginning and three samples at the end of each experiment and calculating the mean. The mean and standard error of the amount of meal emptied were calculated for at least 5 doses of compound, and expressed as percent change from control. Statistical testing was done for each dose of compound and an ED<sub>50</sub> value was estimated if significant ( $p < 0.05$ ) activity was observed at any dose.

The results of the above protocols for a representative number of compounds of the present invention are shown in Table B.

V. ☐ OBSERVATION WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE <sup>1</sup>

This International search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claim numbers 41, 42 because they relate to subject matter not required to be searched by this Authority, namely:

ALTHOUGH CLAIMS 41, 42 ARE DIRECTED TO A METHOD OF TREATMENT OF (DIAGNOSTIC METHOD PRACTISED ON THE HUMAN/ANIMAL BODY) THE SEARCH HAS BEEN CARRIED OUT AND BASED ON THE ALLEGED EFFECTS OF THE COMPOUND/COMPOSITION.

2. ☐ Claim numbers because they relate to parts of the International application that do not comply with the prescribed requirements to such an extent that no meaningful International search can be carried out, specifically:

3. ☐ Claim numbers because they are dependent claims and are not drafted in accordance with the second and third sentences of PCT Rule 6.4(a).

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING <sup>2</sup>

This International Searching Authority found multiple inventions in this International application as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International search report covers all searchable claims of the International application
2. ☐ As only some of the required additional search fees were timely paid by the applicant, this International search report covers only those claims of the International application for which fees were paid, specifically claims:
3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:
4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

## Remark on Protest

- ☐ The additional search fees were accompanied by applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
